

Buttock lift

A **buttock lift**, or gluteal lift, improves the shape and tone of the underlying tissue that supports skin and fat in the buttock area.

Aging, sun damage, pregnancy, significant fluctuations in weight and genetic factors may contribute to poor tissue elasticity that can result in sagging of the buttocks.

In order to achieve a smoother and more pleasing contour, excess sagging skin and fat are removed. A traditional gluteal lift will not make a butt larger, but may improve a dimpled, irregular skin surface. This procedure may be included in a body lift or may be performed separately.

What a buttock lift can't do

Buttock lifts are not intended strictly for the removal of excess fat nor are they intended to add volume to the buttocks.

Fat grafting, buttock implants or auto-augmentation (when some of your own tissue is left underneath the skin) can be used to add volume.

Liposuction is sometimes added for better contouring.
